

## Econometrics II

Name: Tate Mason

## Problem Set 7

Due: April 8, 2026

**Question 1.** Use `dataHW7_Problem1.mat` to complete this exercise. The data is identical to `dataHW6_Problem2.mat` — meaning the structure of the problem is the same as are the underlying parameters. The purpose of this problem is to estimate a simple dynamic discrete choice problem using CCPs. The data contain information on the choices ( $Y$ 's), characteristics that do not vary over time ( $X_1$ 's), and characteristics that do vary over time ( $X_{1t}$ 's). The context of the problem is a dynamic model of labor supply.  $Y$  takes values  $\{0, 1, 2, 3\}$  reflecting retirement, flex-time, part-time, or full-time participation. The first column of  $X_1$  allows for choice-specific constants, while the second column is an indicator for gender.  $X_{1t}$  is a time-varying measure of health. Both sets of  $X$ 's are individual-level characteristics, so the coefficients on these variables must vary by choice. There is a cost to switching labor supply that is common across all switches. The choice in period 0 is given by  $LY$ . Once an individual retires (chooses option 0) they make no further choices: if  $Y_{it} = 0$  then  $Y_{it+1} = 0$ . The columns of  $Y$  and  $X_{1t}$  indicate observations over time, ten periods in all, so that period 10 is a static problem. Individuals are uncertain about future health. Given  $X_{1t}$  and  $Y_t$ , the health transition is:

$$X_{1,t+1} = \alpha_0 + \alpha_1 X_{1t} + \alpha_2 \mathbf{1}(Y_t = 2) + \alpha_3 \mathbf{1}(Y_t = 3) + \varepsilon_{t+1} \quad (1)$$

for  $Y_t > 0$ , where  $\varepsilon_{t+1} \sim \mathcal{N}(0, \sigma)$  is unknown to the individual until time  $t + 1$ .

(a) Estimate the transition parameters, the  $\alpha$ 's and  $\sigma$ .

*Solution.*

Table 1: OLS Estimates  
Parameter

|               |        |
|---------------|--------|
| $\alpha_0$    | 0.015  |
| $\alpha_1$    | -0.754 |
| $\alpha_{pt}$ | 0.035  |
| $\alpha_{ft}$ | -0.257 |
| $\sigma$      | 1.003  |

(b) Estimate the CCP's via a single logit model of retirement based on LY, X1, X1t, and a set of time dummies.

*Solution.*

Table 2: Part B: Conditional Choice Probability Logit Estimates

| Variable                                      | Coef.   |
|-----------------------------------------------|---------|
| $X_1$ (Constant)                              | -3.6991 |
| $X_2$ (Gender)                                | -0.8556 |
| $X_t$ (Health)                                | -0.3494 |
| $Y_0$ (Initial state)                         | 0.0115  |
| $\mathbf{1}(\tilde{Y}_{t-1} = 2)$ (Part-time) | -0.1116 |
| $\mathbf{1}(\tilde{Y}_{t-1} = 3)$ (Full-time) | -0.0807 |
| $t = 2$                                       | -0.0443 |
| $t = 3$                                       | 0.1227  |
| $t = 4$                                       | 0.2846  |
| $t = 5$                                       | 0.6496  |
| $t = 6$                                       | 1.0620  |
| $t = 7$                                       | 1.5239  |
| $t = 8$                                       | 2.1992  |
| $t = 9$                                       | 3.6510  |
| Observations                                  |         |
| 39,413                                        |         |
| Pseudo $R^2$                                  |         |
| 0.2354                                        |         |

(c) Use the CCP estimates and the future value terms calculated in (C) to estimate choice specific parameters, switching costs, and the discount factor via multinomial logit.

*Solution.*

Table 3: Part D: Dynamic Discrete Choice Estimates (CCP Method)

| Parameter                             | Estimate | Truth |
|---------------------------------------|----------|-------|
| <i>Flex-time (<math>j = 1</math>)</i> |          |       |
| Constant                              | -0.8940  | -0.75 |
| Gender                                | 0.5936   | 0.25  |
| Health                                | 0.1695   | 0.25  |
| <i>Part-time (<math>j = 2</math>)</i> |          |       |
| Constant                              | -0.3305  | -0.25 |
| Gender                                | 0.8890   | 0.50  |
| Health                                | 0.4162   | 0.50  |
| <i>Full-time (<math>j = 3</math>)</i> |          |       |
| Constant                              | -1.0477  | -0.85 |
| Gender                                | 1.1255   | 0.75  |
| Health                                | 0.6673   | 0.75  |
| Switching cost                        | 0.4239   | 0.40  |
| Discount factor $\beta$               | 0.7796   | 0.80  |
