

No Variety Specification: $U_{ijt} = \beta_i X_{ijt} + \varepsilon_{ijt}$

In this specification, love of variety does not enter. Only preference for characteristics. We see that $\approx 95\%$ of the probability mass is on products 4, 5, and 6, with an inclusive value of 11.36. All that happened with the introduction of this product is mass shifted from $5 \rightarrow 6$. Product 6 = product 5 in value, thus it makes sense that it appears probability is being taken from 5.

Variety Specification: $U_{ijt} = \beta_i X_{ijt} + \gamma_i \log(1 + \Sigma^2) + \varepsilon_{ijt}$

where $\Sigma^2 = X_{jt} - \frac{1}{s} \sum_{s=1}^{t-1} X_{js}$ and $\gamma_i \in \{6, 9, 12\}$, we find that higher levels of γ lead to higher inclusive values. Interestingly, the addition of a product leads to stable choices of that product across the three variety levels, with lower γ more likely to select it due to its value being the same as 5's. IV decreases for all variety lovers. Increases in base model. Decreases are slight, though.

No Variety (New Product, No Entry)	Product	CCP	Product	CCP
